

Kerbal Space Program - Bug #1104

Modular Girder Segment XI gets "Field Exception" when attaching to anything.

Description

So while doing some design work I found this debug error. And at first thought that some of my mods didn't make it to 0.21, so after a fresh install I got this error:

It doesn't seem to be due to what I'm attaching it to, as it is that specific module in every instance that connects incorrectly. It's connected, but not graphically. Meaning that if I click on the "red unconnected" device it will move around the pod it is connected to.

Not sure what else to provide here, sorry if this is a double post on the same issue.

Modular Girder Segment XI

[Exception]: MissingFieldException: Field '.FlightGlobals.fetch' not found.

History

Are you using the B9 pack or the Editor Extensions? I had a similar problem when I was first trying those out, but it disappeared after I removed those mods so I just assumed it was related to/caused by one of them.

Hmm, can't get this to occur here with the Girder. Any specific reproduction cases?
