Description			
<p>Flying around the Kerbol system while scienceing is tons of fun. Since recovered data is worth a lot more than transmitted data, I try to bring as much back as possible. However, this proves difficult with the larger experiments. It would be really nice to have some kind of data storage part, one that you can store experimental results in and then bring back with you.</p> <p>I imagine it would look kind of like the Instrument Unit from the Saturn V (pictured below). It would be small enough to stick onto the command pod and bring back to Kerbin, but would be heavy, expensive, and would only be able to hold a limited amount of data. The advantage is that by recovering the data, the science value would be much higher.</p> <p>475px-Saturn_V_IU.jpg</p>
