Description

When placing landing gear in planes, I like to invert the steering of the gears in the back for get extra turn rate. But the option in the tweakable menu doesn't show which is its current state. All the other options (like unlock steering) show if they are enabled or not, except invert steering. This makes it difficult to know if "did I already toggled them? or did symmetry reset their state?", you can only launch the plane and test it for find out.

History
