#### Description

I've had this trouble for a while. Kerbol EVA on the mun and walks about for a minute and then poof... Dead. I'm on normal speed and helmet is on. To me it looks like they are crashing under the texture. I have rtx gpu, I've uninstalled game and reinstalled, still getting same problems and it's stock game with dlc. The game is unplayable with this bug, I've got over 100 hours of game play so I know this shouldn't be happening while kerbal is just walking around. Same happens if I go rcs and fly with kerbol on mun, fly for one min then poof dead, not crashed into anything.

Please help.

Disclaimer: I am not a Squad/Private Division/Intercept Games employee but I have been involved in bug reporting for KSP since 2016

Did you delete the KSP folder after uninstalling it? Uninstalling can still leave files behind

I don't have the same issues that you are having.

If you want some help either contact me on the main KSP forums (<https://forum.kerbalspaceprogram.com/>) as Anth12 or contact me on the reddit KSP discord (<https://discord.gg/dUDZyM2>) as anth1256
