Description

Hi, just started to play 1.2 and found the relay network to be a fun addition to the game, but some aspects need clarification in the KSpedia, and requires a lot of hit and miss missions to learn how it really works.

things that require clarification are:

difference between relay and normal antennas. eg. which is which, who can talk with who?

meaning of parameters in the antenna descriptions.

signal strength calculation.

parameters of when there is partial control, or no control.

perhaps add example of networks (kerbin system, interplanetary) for newbies.

Thanks for listening!
