

Kerbal Space Program - Bug #20747

LY-01 Fixed Landing Gear damper force is low with its default, makes planes that actually weigh something bounce like crazy

12/22/2018 07:15 PM - Nebbie

Status:	New	Start date:	12/22/2018
Severity:	Low	% Done:	0%

Version:	1.6.0	Language:	English (US)
Platform:	Linux, Windows	Mod Related:	No
Expansion:	Core Game, Making History		

Description

Built a standard plane in career mode as soon as I was able to and it would bounce dramatically, registering up to .6m/s on the navball, just stationary on the runway or while moving across KSC. Figured out that it's the LY-01s and that they appear to have very low damper force with their default settings.

History

#1 - 12/24/2018 08:54 PM - Nebbie

I would like to further not that just hitting the override reduces the bouncing significantly, before increasing the damper, suggesting auto is way below what's proper.

#2 - 12/25/2018 09:46 AM - Dfa-DoM

- Platform Windows added

- Expansion Making History added

Restarting a career from scratch, I can confirm the issue is also relevant on Windows (and no way to minimize the effect with only few tech nodes studied).
