Description

Hi.

In early career games, when you don't have fairings, but you need to do all sorts of things in orbit, including orbital cleanup, station building, interplanetary ship orbital assembly, etc, having a small utility craft that can pierce through the atmosphere and reach my orbital targets is important.

Having a docking port is critical for this, but to use the small docking port I need to accept that there will be lots of drag. Also for small SSTOs there is no option to go small and keep drag away.

We need a shielded clamp-o-tron junior.
