Description

In KSP Enhanced Edition since the initial patch after release the sound on medium and large rocket engines and jet engines has been corrupted. It is not a local hardware or speaker issue nor is it a corrupt download. The issue is not also due to low frame rates or high part counts. A simple rocket of 3 parts causes the sound glitch.

Parts tested so far:

CR-7 Rapier  
Mammoth  
Twin-Boar

I believe in earlier patches there were other parts that caused issues but it appears with the most recent versions and DLC that only these parts remain. Sound settings in configuration are unchanged.

I am on version 1.0.1.9
