Have you got a savegame and a game log you can upload? Are there any mods involved? Are you running with Windows, Mac or Linux? If running under Steam, have you tried re-verifying the game install?

If you can include some of this info and logs (see <https://bugs.kerbalspaceprogram.com/projects/ksp/wiki> for locations of files), this would be a great help in reproducing your error or finding out what might be going wrong.
