

Kerbal Space Program - Bug #9353

Dynawing's wings jolt on load where the back wheels are

04/20/2016 07:44 PM - smjjames

Status:	Needs Clarification	Start date:	04/20/2016

Expansion:			

Description

I'm 99.9% sure this is new in 1.1 full release. When I was checking out the stock craft, I noticed that on load, the two sections of wing where the back gears are briefly separate for a second before snapping back to where they were.

Probably related to whatever is going on in #8672

I'm putting this on very low because it doesn't appear to affect flight performance. I tried checking out the Dynawing final approach scenario and while the jolt does happen on load there, I'm not sure if it affected the flight because I screwed it up due to the fact that I had no idea what I was doing really.
